A MATCH MADE IN CHAOS

Race Eve Pre-Flight Check

V1.6.6 deep audit | 57 checks. Zero failures. Now with 70 mph Special Weather class. | Race day is tomorrow

The Setup

Robby said "the event is tomorrow, deep audit, then also wire in the 70 mph Special Weather class because Nevada decides the weather, not us." So the audit script went and poked the V1.6.6 build with a stick in **57 different places** and waited for something to scream. Nothing screamed. Then we made sure that if the sky goes sideways and the race drops to 70 mph SW, the timer still tells the truth. It does.

T-MINUS RACE DAY

*Fifty-seven checks. Zero failures.
70 SW class wired in. CP6 wired in.
Tomorrow we go.*

The clipboard. 57 boxes. 57 checks. 57 little green ticks.

What "deep audit" actually meant

The nerd with a magnifier checked every single thing that could make the app lie to you on race day. File integrity, the JS syntax, every race-entry value, every coordinate, the perfect-time math *for both 125 and 70 SW*, the polyline projection, the line-crossing detector, the splits, the CP6 red-flag finish, all the UI element IDs, the GPS plumbing, the Wake Lock, the manual override paths, the service worker cache (now v1.6.6), the version stamps, the new class-aware tech/min lookup, and a full regression sweep on BBORR so we wouldn't break Big Bend while fixing Nevada. Nothing came back broken.

Coordinates: Bang on Official

COORDS: BANG ON OFFICIAL

SB start, SB finish, NB start, NB finish.

All four within 0.0 m of the official

course-note coordinates. The wheel guy approves.

All four NORC timing-line coordinates (SB start at Lund, SB finish at Hiko, NB start at Hiko, NB finish at the mid-point) match the official 2026 NORC course notes to **0.0 meters**. Not 4. Not 1. Not a single hair off.

Perfect Times: Both Classes, From the Formula

PERFECT TIMES: CORRECT

Class 125 · Combined: 1:12:39.744

Class 70 SW · Combined: 2:09:45.257

Math from the formula. No corrupted table.

Race	Distance	Class 125 perfect	Class 70 SW perfect	Tech / Min
NORC SB Leg 1	90.00 mi	43:12.000	1:17:08.571	125→140/95 · 70→90/50
NORC NB Leg 2	61.38 mi	29:27.744	52:36.686	125→140/95 · 70→90/50
COMBINED	151.38 mi	1:12:39.744	2:09:45.257	—

Pure formula (distance ÷ class × 3600) against the official surveyed distances. The corrupted lookup table that was hiding 120 seconds on the NB practice run is **gone**. The app cannot lie to you about the perfect time anymore — it has nothing left to lie with.

70 SW (Special Weather): The New Class

70 SW · SPECIAL WEATHER

Class speed: 70 mph average target.

Tech / DQ: 90 mph max. Min: 50 mph.

Override is +20 / -20 (tighter than normal).

Why this matters: if NORC race control declares Special Weather at the driver's meeting, every car drops to a 70 mph target with a tighter *tech / min* band than the regular classes. The regular NORC band is +15 over class and -30 under. Special Weather is +20 / -20: tighter on top, tighter on bottom. V1.6.6 wires this in as a per-class override on the three NORC race entries (SB, NB, SSCC), so the moment Josh picks **Class 70 SW** the app pulls **90 tech / 50 min** automatically instead of the default 85/40 formula. The regular classes (95 through 180) are unchanged. BBORR is unchanged. Big Bend gets exactly what it always got.

Field	Class 125 (regular)	Class 70 SW (special weather)
Class speed	125 mph	70 mph
Tech / DQ over	140 mph	90 mph
Min / DQ under	95 mph	50 mph
Margin formula	NORC default: +15 / -30	Override: +20 / -20
Perfect Leg 1 SB	43:12.000	1:17:08.571
Perfect Leg 2 NB	29:27.744	52:36.686
Perfect Combined	1:12:39.744	2:09:45.257

CP6: The Red-Flag Finish Point

CP6: RED-FLAG FINISH POINT

SB mile 57.243 · NB mile 32.767.

Banner is live, audio fires on crossing, snapshot locks. Works for 125 and 70 SW.

Per Josh: if the course is red-flagged mid-event, **Checkpoint 6 becomes the official scoring finish** for both legs. V1.6.6 wires this in for every class — including 70 SW:

Leg	CP6 mile	Perfect @ 125	Perfect @ 70 SW	On-pace check
NORC SB	57.243	27:28.598	49:03.926	cumulative avg = class speed
NORC NB	32.767	15:43.690	28:05.160	cumulative avg = class speed

On the race screen you'll see a dedicated **CP6 / RED-FLAG FINISH** band above the splits. Before CP6: live cumulative average mph + projected delta at CP6 + miles to go. The instant the car crosses CP6 the banner flashes green, the snapshot locks, and the app speaks: *"Checkpoint six. Red flag finish point. Average X miles per hour. Delta plus/minus Y seconds."* The locked snapshot lands in the JSON export under `red_flag_checkpoint` — race-day evidence whether the red flag drops or not. Note: the previous PDF's CP6 numbers were drifted by ~0.09 s from rounding the mile-marker to 2 decimals. V1.6.6 uses the 3-decimal surveyed values; numbers above are exact.

The Full Pre-Flight Checklist (the green ticks)

Check	Result
✓ File integrity	Both <script> tags balanced. Helpers added cleanly. Nothing got eaten this time either.
✓ Race entries	All 6 parsed (norc_sb, norc_nb, ssc, bborr_south, bborr_north, custom). Distances, classes, tech, min, start, fi
✓ NORC coordinates	All four (SB start, SB finish, NB start, NB finish) within 0.0 m of the official 2026 course notes.
✓ 70 SW wiring	Class 70 added to all 3 NORC entries (sscc, norc_sb, norc_nb). class_overrides = { 70: { tech_above:20, min_
✓ class-aware helpers	getTechSpeed / getMinSpeed / getClassLabel defined. 4 callsites patched. Zero direct reads of tech_above_cl
✓ Resolved margins	Class 70 SW → tech 90 / min 50. Class 125 → tech 140 / min 95. Both confirmed by math.
✓ Perfect-time math	10 cases pass: 125 SB/NB/Combined, 70 SW SB/NB/Combined, CP6 SB/NB for both classes. All match the fo
✓ CP6 wiring	CP6_MILE constants right (SB 57.243, NB 32.767, SSCC 57.243). Banner + snapshot + JSON field + audio ca
✓ CP6 bindings	6 DOM IDs present (cp6Banner, cp6Avg, cp6Tgt, cp6ToGo, cp6Snapshot, cp6Msg).
✓ Course progress	Splits, delta, finish gate all anchored to courseProgressMi (not raw GPS odometer).
✓ Shoulder system	Two-shoulder capture intact (63 references). Single-point capture clears stale shoulders. reapplyAllShoulders r
✓ BBORR regression	tech_above_class still 25. min_below_class still 30. No class_overrides leaked in. Polyline still there. Big Bend
✓ Service worker	Cache name bumped to v1.6.6. Phones will refetch on next launch.
✓ Version stamps	41 V1.6.6 stamps in the file. Zero leftover V1.6.5 stragglers.

Your Race-Day Card (cut this out, tape it to the dash)

	NORC SB (Leg 1)	NORC NB (Leg 2)	Combined
Distance	90.00 mi	61.38 mi	151.38 mi
Perfect time @ 125	43:12.000	29:27.744	1:12:39.744
Perfect time @ 70 SW	1:17:08.571	52:36.686	2:09:45.257
Tech / DQ over	125→140 · 70→90 mph	125→140 · 70→90 mph	—
Min / DQ under	125→95 · 70→50 mph	125→95 · 70→50 mph	—
CP6 mile	57.243	32.767	—
CP6 perfect @ 125	27:28.598	15:43.690	—
CP6 perfect @ 70 SW	49:03.926	28:05.160	—

What to confirm on the phone at the grid: ribbon reads **V1.6.6**. Pick NORC Leg 1, class 125 — perfect time should display **43:12.000**. Then pick class 70 SW — perfect time should display **1:17:08.571** and the tech/min line should read **90 / 50**. If those three numbers are right, the whole build is right.
